1. Introduction

The Train Ticket Booking System is a basic Python project designed to demonstrate how a simple ticket booking process can be performed using Python. The program takes passenger details, displays available trains, accepts a train choice, and shows the booking details and fare.

2. Objective

The main objective of this project is to understand basic Python programming concepts and apply them to a simple real-world problem such as train ticket booking.

3. Features

- Takes passenger name as input.
- Takes source city and destination.
- Displays three available trains.
- Allows the user to select a train.
- Shows the fare according to the selected train.
- Displays the final booking details.

4. Concepts Used

The project uses input and output statements, variables, conditional statements (if-elif-else), integer conversion, and basic program flow.

5. Algorithm / Working

1. Start the program.
2. Enter the passenger name.
3. Enter the source city and destination.
4. Display the available trains.
5. Ask the user to select a train.
6. Use if-elif-else to assign the train name and fare.
7. Display the booking details.
8. End the program.

6. Python Code

```
print("==== Train Ticket Booking =====")

name = input("Enter your name: ")
city = input("Enter your city: ")
destination = input("Enter destination: ")

print("\nAvailable Trains:")
print("1. Bhopal Express")
print("2. Shatabdi Express")
print("3. Rajdhani Express")

choice = int(input("Select train (1-3): "))

if choice == 1:
    train = "Bhopal Express"
    fare = 500
elif choice == 2:
    train = "Shatabdi Express"
    fare = 800
elif choice == 3:
    train = "Rajdhani Express"
    fare = 1000
else:
    print("Invalid choice")
    exit()

print("\n==== Booking Details =====")
print("Passenger:", name)
print("From:", city)
print("To:", destination)
print("Train:", train)
print("Fare: Rs.", fare)

print("\nTicket booked successfully!")
```

7. Sample Output

```
===== Train Ticket Booking =====
Enter your name: Adarsh Gupta
Enter your city: Bhopal
Enter destination: Delhi

Available Trains:
1. Bhopal Express
2. Shatabdi Express
3. Rajdhani Express
Select train (1-3): 2

===== Booking Details =====
Passenger: Adarsh Gupta
From: Bhopal
To: Delhi
Train: Shatabdi Express
Fare: Rs. 800

Ticket booked successfully!
```

8. Conclusion

This project demonstrates a simple train ticket booking system using Python. It helped in understanding variables, user input, conditional statements, and basic decision-making. The project can be extended in the future by adding more trains, passenger seats, dates, payment options, and ticket numbers.
